

Given a boolean 2D-matrix, find the no of islands. A group of connected 1's form an island.

For eg, the below matrix contains 5 islands
 $\{1, 1, 0, 0, 0\}$, $\{0, 1, 0, 0, 1\}$, $\{1, 0, 0, 1, 1\}$, $\{0, 0, 0, 0, 0\}$,
 $\{1, 0, 1, 0, 1\}$. A cell in the 2D matrix can be connected to neighbours. Use disjoint sets to implement the above scenario.

```
class DisjointUnionSets
```

```
{
    vector<int> rank, parent;
```

```
    int n;
```

```
    public:
```

```
        DisjointUnionSets(int n)
```

```
{
```

```
    rank.resize(n);
```

```
    parent.resize(n);
```

```
    this->n = n;
```

```
    makeSet();
```

```
}
```

```
void makeSet()
```

```
{
```

```
    for (int i = 0; i < n; i++)
```

```
        parent[i] = i;
```

```
}
```

```
int find(int x)
```

```
{
```

```
    if (parent[x] != x)
```

```
{
```

```
        return
```

```
        find(parent
```

```
        [x]);
```

```
}
```

```
    return x;
```

```
}
```

```
void Union (int x, int y)
```

```
{
```

```
    int xroot = find(x);
```

```
    int yroot = find(y);
```

```
    if (xroot == yroot)
```

```
        return;
```

```
    if (rank[xroot] < rank[yroot])
```

```
        parent[xroot] = yroot;
```

```
    else if (rank[yroot] < rank[xroot])
```

```
        parent[yroot] = xroot;
```

```
    else
```

```
    {
```

```
        parent[yroot] = xroot;
```

```
        rank[xroot] = rank[xroot] + 1;
```

```
    }
```

```
}
```

```
};
```

```
int countIslands(vector<vector<int>> a)
```

```
{
```

```
    int n = a.size();
```

```
    int m = a[0].size();
```

```
    DisjointUnionSets *dus = new DisjointUnionSets(n
```

```
int *c = new int [n*m];  
int numberOfIslands = 0;
```

```
for (int j = 0; j < n; j++)
```

```
{  
    for (k = 0; k < m; k++)
```

```
        if (a[j][k] == 1)
```

```
        {  
            int x = dfs(j*m+k);
```

```
            if (c[x] == 0)
```

```
            {  
                numberOfIslands++;
```

```
                c[x]++;
```

```
            }
```

```
        }  
        else
```

```
            c[x]++;
```

```
    }
```

```
}  
}
```

```
return numberOfIslands;
```

```
}
```

```
for (int j = 0; j < n; j++)
```

```
{
    for (int k = 0; k < m; k++)
```

```
    if (a[j][k] == 0)
```

```
        continued;
```

```
    if (j+1 < n && a[j+1][k] == 1)
```

```
        dus → Union(j * (m) + k, (j+1) * (m) + k);
```

```
    if (j-1 >= 0 && a[j-1][k] == 1)
```

```
        dus → Union(j * (m) + k, (j-1) * (m) + k);
```

```
    if (k+1 < m && a[j][k+1] == 1)
```

```
        dus → Union(j * (m) + k, (j) * (m) + k+1);
```

```
    if (k-1 >= 0 && a[j][k-1] == 1)
```

```
        dus → Union(j * (m) + k, (j) * (m) + k-1);
```

```
    if (j+1 < n && k+1 < m && a[j+1][k+1] == 1)
```

```
        dus → Union(j * (m) + k, (j+1) * (m) + k+1);
```

```
    if (j+1 < n && k-1 >= 0 && a[j+1][k-1] == 1)
```

```
        dus → Union(j * m + k, (j+1) * (m) + k-1);
```

```
    if (j-1 >= 0 && k+1 < m && a[j-1][k+1] == 1)
```

```
        dus → Union(j * m + k, (j-1) * m + k+1);
```

```
    if (j-1 >= 0 && k-1 >= 0 && a[j-1][k-1] == 1)
```

```
        dus → Union(j * m + k, (j-1) * m + k-1);
```

```
    }
```

```
}
```

Approach:

- 1) Initialize result (count of island) as 0
- 2) Traverse each index of the 2D matrix
- 3) If the value at index is 1, check all its 8 neighbours.
If a neighbour is also equal to 1, take the union of index & its neighbour
- 4) Now define an array of size row * column to store frequencies of all sets
- 5) Now traverse the matrix again
- 6) If the value at the index is 1, find its set.
- 7) If the frequency of the set in the above array is 0, increment the result by 1.
